

DECEMBER 1988 MINUTES

There was a pretty good turnout for the December meeting, considering the holidays.

Brian Vaceluke explained his version of the home navigation program, but his robot was still sick, so he couldn't demo it.

Another member (forgive me for not having his name) showed a device for detecting the rate of turn in an airplane. He is designing a robotic airplane, and will use this device for navigation. It is a very sensitive air flow type of gauge. I can't tell you much more, since I missed the meeting. See what you missed, too?
